

School of Computer Science and Artificial Intelligence

Lab Assignment # 7.2

Program : B. Tech (CSE)
Specialization : AIML
Course Title : AI Assisted Coding
Course Code : 23CS002PC304
Semester : VI
Academic Session : 2025-2026
Name of Student : P.Sindhu
Enrollment No. :2303A52207
Batch No. : 33
Date : 03/02/26

Lab 7: Error Debugging with AI (Week 4 – Tuesday)

Topic: Systematic approaches to finding and fixing bugs using AI

Task 1 – Runtime Error Due to Invalid Input Type Bug Analysis (AI Explanation)

- `input()` always returns a **string**
- Adding a string and an integer causes a **TypeError**

```

  3]
  5s
  num = int(input("Enter a number: "))
  result = num + 10
  print(result)

  ... Enter a number: 5
  15

  4]
  0s
  numbers = [10, 20, 30]
  for i in range(len(numbers)):
    print(numbers[i])

  10
  20
  30

```

Expected Output – 1

- AI converts user input to an integer
- Runtime error is eliminated

Task 2 – Incorrect Function Return Value Bug Analysis (AI Explanation)

- Function calculates the square but **does not return it**
- Without return, Python returns None

```

  9]
  0s
  def square(n):
    result = n * n

  + Code + Text

  10]
  0s
  def square(n):
    result = n * n
    return result

```

Expected Output – 2

- Function correctly returns the square of the number

Task 3 – IndexError in List Traversal Bug Analysis (AI Explanation)

- range(0, len(numbers)+1) goes **one step too far**
- Causes IndexError: list index out of range

Buggy Code

```
[2] 0s numbers = [10, 20, 30]
for i in range(0, len(numbers)+1):
    print(numbers[i])
```

... 10
20
30

Traceback (most recent call last)
/tmp/ipython-input-2172525831.py in <cell line: 0>()
1 numbers = [10, 20, 30]
2 for i in range(0, len(numbers)+1):
----> 3 print(numbers[i])

IndexError: list index out of range

Next steps: [Explain error](#)

AI-Corrected Code

```
[4] 0s numbers = [10, 20, 30]
for i in range(len(numbers)):
    print(numbers[i])
```

... 10
20
30

[View Code](#) [View Text](#)

Expected Output – 3

- Loop boundary corrected
- Prevents out-of-range access

Task 4 – Uninitialized Variable Usage

Bug Analysis (AI Explanation)

- ☐ Variable total is used before assignment
- ☐ Causes NameError

Buggy Code

```
[5] 0s if True:
    pass
    print(total)
```

... -----
Traceback (most recent call last)
/tmp/ipython-input-3608487366.py in <cell line: 0>()
1 if True:
2 pass
----> 3 print(total)

NameError: name 'total' is not defined

Next steps: [Explain error](#)

```
AI-Corrected Code

[6] ✓ Os
total = 0
if True:
    pass
print(total)

... 0

+ Code + Text
```

Expected Output – 4

- Variable initialized before use
- Program runs safely

Task 5 – Logical Error in Student Grading System Bug Analysis (AI Explanation)

- Logical order of grading conditions is incorrect
- marks ≥ 80 wrongly assigns grade **C**
- else block assigns **B** incorrectly

```
Buggy Code

[7] ✓ Os
marks = 85
if marks >= 90:
    grade = "A"
elif marks >= 80:
    grade = "C"
else:
    grade = "B"
print(grade)

... C

AI-Corrected Code
```

```
AI-Corrected Code

[8] ✓ Os
marks = 85
if marks >= 90:
    grade = "A"
elif marks >= 80:
    grade = "B"
else:
    grade = "C"
print(grade)

... B
```

Expected Output – 5

- Correct grade is assigned based on marks
 - Logical flow fixed
-

Summary: AI-Assisted Debugging Strategies Used

- ✓ Type conversion for runtime errors
- ✓ Return statement validation
- ✓ Loop boundary correction
- ✓ Variable initialization checks
- ✓ Logical condition reordering
