

School of Computer Science and Artificial Intelligence

Lab Assignment # 5.5

Program : B. Tech (CSE)

Specialization : AIML

Course Title : AI Assisted Coding

Course Code : 23CS002PC304

Semester : VI

Academic Session : 2025-2026

Name of Student : P.Sindhu

Enrollment No. : 2303A52207

Batch No. : 33

Lab 5: Ethical Foundations – Responsible AI Coding Practices

Lab Objectives:

- To explore the ethical risks associated with AI-generated Week3 - code.
- To recognize issues related to security, bias, transparency, and copyright.

- To reflect on the responsibilities of developers when using AI tools in software development.
- To promote awareness of best practices for responsible and ethical AI coding.

Lab Outcomes (LOs):

After completing this lab, students will be able to:

- Identify and avoid insecure coding patterns generated by AI tools.
- Detect and analyze potential bias or discriminatory logic in AI-generated outputs.
- Evaluate originality and licensing concerns in reused AI-generated code.
- Understand the importance of explainability and transparency in AI-assisted programming.
- Reflect on accountability and the human role in ethical AI coding.

Description – 1: (Transparency in Algorithm Optimization)

Problem: Use AI to generate two solutions for checking prime numbers.

1. Naive approach
2. Optimized approach

Prompt Used (Zero-shot)

Generate Python code for two prime-checking methods and explain how the optimized version improves performance.

Python Code:

Task

Task 1: Transparency in Algorithm Optimization

Naive approach to check if a number is prime

```
[1] 0s
def is_prime_naive(n):
    if n <= 1:
        return False
    for i in range(2, n):
        if n % i == 0:
            return False
    return True
```

Optimized approach to check if a number is prime

```
[2]
import math

def is_prime_optimized(n):
    if n <= 1:
        return False
    for i in range(2, int(math.sqrt(n)) + 1):
        if n % i == 0:
            return False
    return True
```

Explanation & Time Complexity

Naive Method

- Checks divisibility from 2 to $n-1$
- Time Complexity: $O(n)$
- Inefficient for large numbers

Optimized Method

- Checks divisibility only up to \sqrt{n}
- Time Complexity: $O(\sqrt{n})$
- Faster because factors repeat after square root

Task

– 2: Transparency in Recursive Algorithms Objective

Problem: Generate a recursive Fibonacci function with clear explanations.

Prompt Used (One-shot)

1. Ask AI to add clear comments explaining recursion.
2. Ask AI to explain base cases and recursive calls

Python Code:

```
Task 2: Transparency in Recursive Algorithms

recursive Fibonacci function

[3] ✓ 0s ▶ def fibonacci(n):
    # Base case: Fibonacci of 0 is 0
    if n == 0:
        return 0

    # Base case: Fibonacci of 1 is 1
    if n == 1:
        return 1

    # Recursive case:
    # Fibonacci of n is the sum of Fibonacci of (n-1) and (n-2)
    return fibonacci(n - 1) + fibonacci(n - 2)
```

Explanation

□ Base Cases

- fibonacci(0) returns 0
- fibonacci(1) returns 1

□ Recursive Call

- Function keeps calling itself with smaller values
 - Stops when base cases are reached
-

Task

□ Execution Match

- Each recursive call mirrors the explanation exactly
- Ensures transparency and correctness

Description – 3: Transparency in Error Handling.

Problem: Use AI to generate a Python program that reads a file and processes data.

Prompt Used (Few-shot)

“Generate code with proper error handling and clear explanations for each exception.”

Python Code:

Task 3: Transparency in Error Handling

Python program that reads a file with proper error handling.

```
def read_file(filename):  
    try:  
        file = open(filename, "r")  
        data = file.read()  
        file.close()  
        return data  
  
    except FileNotFoundError:  
        print("Error: File not found.")  
  
    except PermissionError:  
        print("Error: Permission denied.")  
  
    except Exception as e:  
        print("Unexpected error:", e)
```

Explanation of Exceptions:

□ FileNotFoundError

- Occurs when the file does not exist

- **PermissionError** ○ Occurs when access rights are insufficient

Task

- **Generic Exception** ○ Catches unexpected runtime errors

Each explanation directly corresponds to actual Python runtime behavior, ensuring transparency.

Description – 4: Security in User Authentication

Problem: Use AI to generate a Python program that reads a file and processes data.

Prompt :

Check whether the AI uses secure password handling practices.

Initial AI-Generated Issue (Security Flaws)

- Passwords stored in **plain text**
- No hashing
- Weak input validation

Security Risks

- Data breaches
- Password reuse attacks
- Unauthorized access

Task 4: Security in User Authentication

Secure Revised Version

```
import hashlib

def hash_password(password):
    return hashlib.sha256(password.encode()).hexdigest()

def login(stored_hash, entered_password):
    return stored_hash == hash_password(entered_password)
```

Best Practices for Secure Authentication

- Always hash passwords (never store plain text)
- Use strong hashing algorithms (bcrypt, SHA-256, etc.)
- Validate user inputs

Task

- Implement rate limiting and authentication checks
-

Task Description – 5: Privacy in Data Logging

Problem: Determine the minimum of three numbers without using min().

Prompt Used : Examine whether sensitive data is logged unnecessarily or insecurely.

Original AI Logging Risks □ Logs **username, IP address, timestamp**

- IP addresses are sensitive personal data
- Logs stored without masking or protection

Python Code:

Task 5: Privacy in Data Logging

```
import datetime

def log_activity(username):
    masked_user = username[0] + "****"
    timestamp = datetime.datetime.now()
    print(f"User: {masked_user}, Time: {timestamp}")
```

Privacy-Aware Logging Principles

- Log only necessary information
- Mask or anonymize personal data
- Avoid storing IP addresses unless required
- Protect log files from unauthorized access

Conclusion

This lab highlights that **AI-generated code is not automatically ethical or secure.**

Developers are responsible for:

- Reviewing AI outputs
- Ensuring transparency and correctness
- Preventing security and privacy violations
- Maintaining accountability for deployed code

Ethical AI coding requires **human judgment**, not blind trust in AI tools.
